## Schedules and Histories

```
Definition 3.1 (Schedules and histories):
Let \(T=\left\{t_{1}, \ldots, t_{n}\right\}\) be a set of transactions, where each \(t_{i} \in T\) has the form \(\mathrm{t}_{\mathrm{i}}=\left(\mathrm{op}_{\mathrm{i}},<_{\mathrm{i}}\right)\) with \(\mathrm{op}_{\mathrm{i}}\) denoting the operations of \(\mathrm{t}_{\mathrm{i}}\) and \(<_{i}\) their ordering.
(i) A history for T is a pair \(\mathrm{s}=\left(\mathrm{op}(\mathrm{s}),<_{\mathrm{s}}\right)\) s.t.
(a) \(o p(s) \subseteq \cup_{i=1 . . n} o p_{i} \cup \cup_{i=1 . n}\left\{a_{i}, c_{i}\right\}\)
(b) for all \(\mathrm{i}, 1 \leq \mathrm{i} \leq \mathrm{n}: \mathrm{c}_{\mathrm{i}} \in \mathrm{op}(\mathrm{s}) \Leftrightarrow \mathrm{a}_{\mathrm{i}} \notin \mathrm{op}(\mathrm{s})\)
(c) \(\cup_{i=1 . . n}<_{i} \subseteq<_{s}\)
(d) for all \(\mathrm{i}, 1 \leq \mathrm{i} \leq \mathrm{n}\), and all \(\mathrm{p} \in \mathrm{op}_{\mathrm{i}}: \mathrm{p}<_{\mathrm{s}} \mathrm{c}_{\mathrm{i}}\) or \(\mathrm{p}<_{\mathrm{s}} \mathrm{a}_{\mathrm{i}}\)
(e) for all \(p, q \in o p(s)\) s.t. at least one of them is a write and both access the same data item: \(\mathrm{p}<{ }_{\mathrm{s}} \mathrm{q}\) or \(\mathrm{q}<{ }_{\mathrm{s}} \mathrm{p}\) (ii) A schedule is a prefix of a history.
```

Definition 3.2 (Serial history):
A history s is serial if for any two transactions $t_{i}$ and $t_{j}$ in $s$, where $i \neq j$, all operations from $t_{i}$ are ordered in $s$ before all operations from $\mathrm{t}_{\mathrm{j}}$ or vice versa.

## Example Schedules and Notation

Example 3.4:

```
trans(s):=
    {t}|\textrm{s}\mathrm{ contains step of }\mp@subsup{t}{i}{}
commit(s):=
    {t
abort(s):=
    {t, trans(s)| | a i f s }
active(s):=
    trans(s) - (commit(s) \cup abort(s))
```

Example 3.6:

$$
r_{1}(x) r_{2}(z) r_{3}(x) w_{2}(x) w_{1}(x) r_{3}(y) r_{1}(y) w_{1}(y) w_{2}(z) w_{3}(z) c_{1} a_{3}

## Correctness of Schedules

1. Define equivalence relation $\approx \approx$ on set $S$ of all schedules.
2. "Good" schedules are those in the equivalence classes of serial schedules.

- Equivalence must be efficiently decidable.
- "Good" equivalence classes should be "sufficiently large".

For the moment, disregard aborts: assume that all transactions are committed.

## Herbrand Semantics of Schedules

## Definition 3.3 (Herbrand Semantics of Steps):

For schedule $s$ the Herbrand semantics $H_{s}$ of steps $r_{i}(x), w_{i}(x) \in o p(s)$ is:
(i) $H_{s}\left[r_{i}(x)\right]:=H_{s}\left[w_{j}(x)\right]$ where $w_{j}(x)$ is the last write on $x$ in $s$ before $r_{i}(x)$.
(ii) $\mathrm{H}_{s}\left[\mathrm{w}_{\mathrm{i}}(\mathrm{x})\right]:=\mathrm{f}_{\mathrm{ix}}\left(\mathrm{H}_{s}\left[\mathrm{r}_{\mathrm{i}}\left(\mathrm{y}_{\mathrm{s}}\right)\right], \ldots, \mathrm{H}_{s}\left[\mathrm{r}_{\mathrm{i}}\left(\mathrm{y}_{\mathrm{m}}\right)\right]\right)$ where the $\mathrm{r}_{\mathrm{i}}\left(\mathrm{y}_{\mathrm{j}}\right), 1 \leq \mathrm{j} \leq \mathrm{m}$, are all read operations of $\mathrm{t}_{\mathrm{i}}$ that occcur in s before $\mathrm{w}_{\mathrm{i}}(\mathrm{x})$ and $f_{i x}$ is an uninterpreted $m$-ary function symbol.

## Herbrand Semantics of Schedules

## Definition 3.3 (Herbrand Semantics of Steps):

For schedule $s$ the Herbrand semantics $H_{s}$ of steps $r_{i}(x), w_{i}(x) \in o p(s)$ is:
(i) $\mathrm{H}_{s}\left[\mathrm{r}_{\mathrm{i}}(\mathrm{x})\right]:=\mathrm{H}_{\mathrm{s}}\left[\mathrm{w}_{\mathrm{j}}(\mathrm{x})\right]$ where $\mathrm{w}_{\mathrm{j}}(\mathrm{x})$ is the last write on x in s before $\mathrm{r}_{\mathrm{i}}(\mathrm{x})$.
(ii) $\mathrm{H}_{\mathrm{s}}\left[\mathrm{w}_{\mathrm{i}}(\mathrm{x})\right]:=\mathrm{f}_{\mathrm{ix}}\left(\mathrm{H}_{\mathrm{s}}\left[\mathrm{r}_{\mathrm{i}}\left(\mathrm{y}_{\mathrm{i}}\right)\right], \ldots, \mathrm{H}_{\mathrm{s}}\left[\mathrm{r}_{\mathrm{i}}\left(\mathrm{y}_{\mathrm{m}}\right)\right]\right)$ where the $\mathrm{r}_{\mathrm{i}}\left(\mathrm{y}_{\mathrm{j}}\right), 1 \leq \mathrm{j} \leq \mathrm{m}$, are all read operations of $\mathrm{t}_{\mathrm{i}}$ that occcur in s before $\mathrm{w}_{\mathrm{i}}(\mathrm{x})$ and $f_{i x}$ is an uninterpreted $m$-ary function symbol.

## Definition 3.4 (Herbrand Universe):

For data items $\mathrm{D}=\{\mathrm{x}, \mathrm{y}, \mathrm{z}, \ldots\}$ and transactions $\mathrm{t}, 1 \leq \mathrm{i} \leq \mathrm{n}$, the Herbrand universe $\mathbf{H U}$ is the smallest set of symbols s.t.
(i) $f_{0 x}() \in H U$ for each $x \in D$ where $f_{0 x}$ is a constant, and
(ii) if $w_{i}(x) \in o p_{i}$ for some $t_{i}$, there are $m$ read operations $r_{i}\left(y_{1}\right), \ldots, r_{i}\left(y_{m}\right)$ that precede $w_{i}(x)$ in $t_{i}$, and $v_{1}, \ldots, v_{m} \in H U$, then $f_{i x}\left(v_{1}, \ldots, v_{m}\right) \in H U$.

## Herbrand Semantics of Schedules

## Definition 3.3 (Herbrand Semantics of Steps):

For schedule $s$ the Herbrand semantics $\mathbf{H}_{\mathrm{s}}$ of steps $\mathrm{r}_{\mathrm{i}}(\mathrm{x}), \mathrm{w}_{\mathrm{i}}(\mathrm{x}) \in \mathrm{op}(\mathrm{s})$ is:
(i) $H_{s}\left[r_{i}(x)\right]:=H_{s}\left[w_{j}(x)\right]$ where $w_{j}(x)$ is the last write on $x$ in $s$ before $r_{i}(x)$.
(ii) $\mathrm{H}_{\mathrm{s}}\left[\mathrm{w}_{\mathrm{i}}(\mathrm{x})\right]:=\mathrm{f}_{\mathrm{ix}}\left(\mathrm{H}_{\mathrm{s}}\left[\mathrm{r}_{\mathrm{i}}\left(\mathrm{y}_{\mathrm{i}}\right)\right], \ldots, \mathrm{H}_{\mathrm{s}}\left[\mathrm{r}_{\mathrm{i}}\left(\mathrm{y}_{\mathrm{m}}\right)\right]\right)$ where the $\mathrm{r}_{\mathrm{i}}\left(\mathrm{y}_{\mathrm{j}}\right), 1 \leq \mathrm{j} \leq \mathrm{m}$, are all read operations of $\mathrm{t}_{\mathrm{i}}$ that occcur in s before $\mathrm{w}_{\mathrm{i}}(\mathrm{x})$ and $f_{i x}$ is an uninterpreted $m$-ary function symbol.

## Definition 3.4 (Herbrand Universe):

For data items $\mathrm{D}=\{\mathrm{x}, \mathrm{y}, \mathrm{z}, \ldots\}$ and transactions $\mathrm{t}, 1 \leq \mathrm{i} \leq \mathrm{n}$, the Herbrand universe $\mathbf{H U}$ is the smallest set of symbols s.t.

## Definition 3.5 (Schedule Semantics):

The Herbrand semantics of a schedule $s$ is the mapping
$\mathrm{H}[\mathrm{s}]: \mathrm{D} \rightarrow \mathrm{HU}$ defined by $\mathrm{H}[\mathrm{s}](\mathrm{x}):=\mathrm{H}_{\mathrm{s}}\left[\mathrm{w}_{\mathrm{i}}(\mathrm{x})\right]$,
where $w_{i}(x)$ is the last operation from $s$ writing $x$, for each $x \in D$.

## Herbrand Semantics: Example

$$
\mathrm{s}=\mathrm{w}_{0}(\mathrm{x}) \mathrm{w}_{0}(\mathrm{y}) \mathrm{c}_{0} \mathrm{r}_{1}(\mathrm{x}) \mathrm{r}_{2}(\mathrm{y}) \mathrm{w}_{2}(\mathrm{x}) \mathrm{w}_{1}(\mathrm{y}) \mathrm{c}_{2} \mathrm{c}_{1}

## Final-State Equivalence

Definition 3.6 (Final State Equivalence):
Schedules $s$ and s' are called final state equivalent, denoted $s \approx_{f} s^{\prime}$, if $\mathrm{op}(\mathrm{s})=\mathrm{op}\left(\mathrm{s}^{\prime}\right)$ and $\mathrm{H}[\mathrm{s}]=\mathrm{H}\left[\mathrm{s}^{\prime}\right]$.

## Final-State Equivalence

## Definition 3.6 (Final State Equivalence):

Schedules s and $\mathrm{s}^{\prime}$ are called final state equivalent, denoted $\mathrm{s} \approx_{\mathrm{f}} \mathrm{s}^{\prime}$, if $\mathrm{op}(\mathrm{s})=\mathrm{op}\left(\mathrm{s}^{\prime}\right)$ and $\mathrm{H}[\mathrm{s}]=\mathrm{H}\left[\mathrm{s}^{\prime}\right]$.

## Example a:

$$
\begin{aligned}
& s=r_{1}(x) r_{2}(y) w_{1}(y) r_{3}(z) w_{3}(z) r_{2}(x) w_{2}(z) w_{1}(x) \\
& s^{\prime}=r_{3}(z) w_{3}(z) r_{2}(y) r_{2}(x) w_{2}(z) r_{1}(x) w_{1}(y) w_{1}(x) \\
& H[s](x)=H_{s}\left[w_{1}(x)\right]=f_{11}\left(f_{0 x}()\right)=H_{s^{\prime}}\left[w_{1}(x)\right]=H\left[s^{\prime}\right](x) \\

& \text { (z) }
\end{aligned}
$$

$$
\Rightarrow \mathrm{s} \approx_{\mathrm{f}} \mathrm{~s}^{\prime}
$$

## Final-State Equivalence

## Definition 3.6 (Final State Equivalence):

Schedules s and s are called final state equivalent, denoted $\mathrm{s} \approx_{\mathrm{f}} \mathrm{s}^{\prime}$, if $\mathrm{op}(\mathrm{s})=\mathrm{op}\left(\mathrm{s}^{\prime}\right)$ and $\mathrm{H}[\mathrm{s}]=\mathrm{H}\left[\mathrm{s}^{\prime}\right]$.

## Example a:

```
\(s=r_{1}(x) r_{2}(y) w_{1}(y) r_{3}(z) w_{3}(z) r_{2}(x) w_{2}(z) w_{1}(x)\)
\(s^{\prime}=r_{3}(z) w_{3}(z) r_{2}(y) r_{2}(x) w_{2}(z) r_{1}(x) w_{1}(y) w_{1}(x)\)

## Reads-from Relation

## Definition 3.7 (Reads-from Relation; Useful, Alive, and Dead Steps):

Given a schedule $s$, extended with an initial and a final transaction, $t_{0}$ and $t_{\infty}$.
(i) $\quad r_{j}(x)$ reads $x$ in $s$ from $w_{i}(x)$ if $w_{i}(x)$ is the last write on $x$ s.t. $w_{i}(x)<_{s} r_{j}(x)$.
(ii) The reads-from relation of $s$ is
$R F(s):=\left\{\left(\mathrm{t}_{\mathrm{i}}, \mathrm{x}, \mathrm{t}_{\mathrm{j}}\right) \mid\right.$ an $\mathrm{r}_{\mathrm{j}}(\mathrm{x})$ reads x from a $\left.\mathrm{w}_{\mathrm{i}}(\mathrm{x})\right\}$.
(iii) Step $p$ is directly useful for step $q$, denoted $p \rightarrow q$, if $q$ reads from $p$, or p is a read step and q is a subsequent write step of the same transaction. $\rightarrow^{*}$, the "useful" relation, denotes the reflexive and transitive closure of $\rightarrow$
(iv) Step $p$ is alive in $s$ if it is useful for some step from $t_{\infty}$, and dead otherwise.
(v) The live-reads-from relation of $s$ is
$\operatorname{LRF}(\mathrm{s}):=\left\{\left(\mathrm{t}_{\mathrm{i}}, \mathrm{x}, \mathrm{t}_{\mathrm{j}}\right) \mid\right.$ an alive $\mathrm{r}_{\mathrm{j}}(\mathrm{x})$ reads x from $\left.\mathrm{w}_{\mathrm{i}}(\mathrm{x})\right\}$

## Theorem 3.5:

The problem of deciding for a given schedule $s$ whether $s \in$ VSR holds is NP-complete.

## Properties of VSR

## Definition 3.11 (Monotone Classes of Histories)

Let s be a schedule and $\mathrm{T} \subseteq \operatorname{trans}(\mathrm{s})$. $\Pi_{\mathrm{T}}(\mathrm{s})$ denotes the projection of s onto T . A class E of histories is called monotone if the following holds:
if $s$ is in $E$, then $\Pi_{T}(s)$ is in $E$ for each $T \subseteq \operatorname{trans}(s)$.
VSR is not monotone.

## Example:

$$
\begin{aligned}
& s=w_{1}(x) w_{2}(x) w_{2}(y) c_{2} w_{1}(y) c_{1} w_{3}(x) w_{3}(y) c_{3} \\

Definition 3.15 (Conflict Graph):
Let \(s\) be a schedule. The conflict graph \(G(s)=(V, E)\) is a directed graph with vertices \(\mathrm{V}:=\operatorname{commit}(\mathrm{s})\) and edges \(E:=\left\{\left(t, t^{\prime}\right) \mid t \neq t^{\prime}\right.\) and there are steps \(p \in t, q \in t^{\prime}\) with \(\left.(p, q) \in \operatorname{conf}(s)\right\}\)
```

## Theorem 3.10:

Let $s$ be a schedule. Then $s \in C S R$ iff $G(s)$ is acyclic.

## Corollary 3.4:

Testing if a schedule is in CSR can be done in time polynomial to the schedule's number of transactions.

Example 3.12:
$\mathrm{s}=\mathrm{r}_{1}(\mathrm{y}) \mathrm{r}_{3}(\mathrm{w}) \mathrm{r}_{2}(\mathrm{y}) \mathrm{w}_{1}(\mathrm{y}) \mathrm{w}_{1}(\mathrm{x}) \mathrm{w}_{2}(\mathrm{x}) \mathrm{w}_{2}(\mathrm{z}) \mathrm{w}_{3}(\mathrm{x}) \mathrm{c}_{1} \mathrm{c}_{3} \mathrm{c}_{2}$
G(s):

## Activity

- What is a characterization (in a mathematical sense)?
- How do you prove a necessary and sufficient condition?
- What needs to be shown for the serializability theorem?

## Proof of the Conflict-Graph Theorem

(i) Let s be a schedule in CSR. So there is a serial schedule $\mathrm{s}^{\prime}$ with $\operatorname{conf}(\mathrm{s})=\operatorname{conf}\left(\mathrm{s}^{\prime}\right)$. Now assume that $G(s)$ has a cycle $t_{1} \rightarrow t_{2} \rightarrow \ldots \rightarrow t_{k} \rightarrow t_{1}$. This implies that there are pairs $\left(p_{1}, q_{2}\right),\left(p_{2}, q_{3}\right), \ldots,\left(p_{k}, q_{1}\right)$
with $p_{i} \in t_{i}, q_{i} \in t_{i}, p_{i}<q_{(i+1)}$, and $p_{i}$ in conflict with $q_{(i+1)}$.
Because $\mathrm{s}^{\prime} \approx_{\mathrm{c}} \mathrm{s}$, it also implies that $\mathrm{p}_{\mathrm{i}}<\mathrm{s}^{\prime} \mathrm{q}_{(\mathrm{i}+1)}$.
Because $\mathrm{s}^{\prime}$ is serial, we obtain $\mathrm{t}_{\mathrm{i}}<_{\mathrm{s}^{\prime}} \mathrm{t}_{\mathrm{i}+1)}$ for $\mathrm{i}=1, \ldots, \mathrm{k}-1$, and $\mathrm{t}_{\mathrm{k}}<_{\mathrm{s}^{\prime}} \mathrm{t}_{1}$. By transitivity we infer $\mathrm{t}_{1}<_{\mathrm{s}^{\prime}} \mathrm{t}_{2}$ and $\mathrm{t}_{2}<_{\mathrm{s}^{\prime}} \mathrm{t}_{1}$, which is impossible. This contradiction shows that the initial assumption is wrong. So $\mathrm{G}(\mathrm{s})$ is acyclic.
(ii) Let $\mathrm{G}(\mathrm{s})$ be acyclic. So it must have at least one source node. The following topological sort produces a total order < of transactions:
a) start with a source node (i.e., a node without incoming edges),
b) remove this node and all its outgoing edges,
c) iterate a) and b) until all nodes have been added to the sorted list.

The total transaction ordering order < preserves the edges in $\mathrm{G}(\mathrm{s})$; therefore it yields a serial schedule s' for which $\mathrm{s}^{\prime} \approx_{\mathrm{c}} \mathrm{s}$.

## Commutativity and Ordering Rules

Commutativity rules:
C1: $r_{i}(x) r_{j}(y) \sim r_{j}(y) r_{i}(x)$ if $i \neq j$
C2: $r_{i}(x) w_{j}(y) \sim w_{j}(y) r_{i}(x)$ if $i \neq j$ and $x \neq y$
C3: $w_{i}(x) w_{j}(y) \sim w_{j}(y) w_{i}(x)$ if $i \neq j$ and $x \neq y$
Ordering rule:
C4: $o_{i}(x), p_{j}(y)$ unordered $\sim>o_{i}(x) p_{j}(y)$ if $x \neq y$ or both $o$ and $p$ are reads

Example for transformations of schedules:

$$
\begin{array}{ll}
s & w_{1}(x) \underbrace{}_{2}(x) w_{1}(y) w_{1}(z) r_{3}(z) w_{2}(y) w_{\beta}(y) w_{3}(z) \\
\sim[C 2] \quad & w_{1}(x) w_{1}(y) \underbrace{}_{2}(x) w_{1}(z) w_{2}(y) r_{3}(z) w_{3}(y) w_{3}(z) \\
\sim[C 2] \quad & w_{1}(x) w_{1}(y) w_{1}(z) r_{2}(x) w_{2}(y) r_{3}(z) w_{3}(y) w_{3}(z) \\
= & t_{1} t_{2} t_{3}
\end{array}
$$

## Commutativity-based Reducibility

Definition 3.16 (Commutativity Based Equivalence):
Schedules $s$ and s' s.t. $o p(s)=o p(s ')$ are commutativity based equivalent, denoted $\mathrm{s} \sim * \mathrm{~s}$ ', if s can be transformed into s' by applying rules C1, C2, C3, C4 finitely many times.

## Theorem 3.11:

Let s and $\mathrm{s}^{\prime}$ be schedules s.t. $\mathrm{op}(\mathrm{s})=\mathrm{op}\left(\mathrm{s}^{\prime}\right)$. Then $\mathrm{s} \approx_{\mathrm{c}} \mathrm{s}^{\prime}$ iff $\mathrm{s} \sim^{*}$ s'.

## Commutativity-based Reducibility

Definition 3.16 (Commutativity Based Equivalence):
Schedules $s$ and $\mathrm{s}^{\prime} \mathrm{s}$.t. $\mathrm{op}(\mathrm{s})=\mathrm{op}\left(\mathrm{s}^{\prime}\right)$ are commutativity based equivalent, denoted $\mathrm{s} \sim$ * s ', if s can be transformed into $\mathrm{s}^{\prime}$ by applying rules C1, C2, C3, C4 finitely many times.

## Theorem 3.11:

Let s and $\mathrm{s}^{\prime}$ be schedules s.t. $\mathrm{op}(\mathrm{s})=\mathrm{op}\left(\mathrm{s}^{\prime}\right)$. Then $\mathrm{s} \approx_{\mathrm{c}} \mathrm{s}^{\prime}$ iff $\mathrm{s} \sim^{*} \mathrm{~s}^{\prime}$.

## Definition 3.17 (Commutativity Based Reducibility):

Schedule $s$ is commutativity-based reducible if there is a serial schedule s' s.t. s ~* s'.

## Corollary 3.5:

Schedule s is commutativity-based reducible iff $\mathrm{s} \in \mathrm{CSR}$.

## Order Preserving Conflict Serializability

## Definition 3.18 (Order Preservation):

Schedule $s$ is order preserving conflict serializable if it is
conflict equivalent to a serial schedule s' and
for all $\mathrm{t}, \mathrm{t}^{\prime} \in \operatorname{trans}(\mathrm{s})$ : if t completely precedes $\mathrm{t}^{\prime}$ in s , then the same holds in $\mathrm{s}^{\prime}$. OCSR denotes the class of all schedules with this property.

Theorem 3.12:
OCSR $\subset \mathrm{CSR}$.

Example 3.13:
$\mathrm{s}=\mathrm{w}_{1}(\mathrm{x}) \mathrm{r}_{2}(\mathrm{x}) \mathrm{c}_{2} \mathrm{w}_{3}(\mathrm{y}) \mathrm{c}_{3} \mathrm{w}_{1}(\mathrm{y}) \mathrm{c}_{1}$
$\rightarrow \in \operatorname{CSR}$
$\rightarrow \notin$ OCSR

## Commit-order Preserving Conflict Serializability

Definition 3.19 (Commit Order Preservation):
Schedule $s$ is commit order preserving conflict serializable if
for all $\mathrm{t}_{\mathrm{i}}, \mathrm{t}_{\mathrm{j}} \in \operatorname{trans}(\mathrm{s})$ : if there are $\mathrm{p} \in \mathrm{t}_{\mathrm{i}}, \mathrm{q} \in \mathrm{t}_{\mathrm{j}}$ with $(\mathrm{p}, \mathrm{q}) \in \operatorname{conf}(\mathrm{s})$ then $\mathrm{c}_{\mathrm{i}}<\mathrm{c}_{\mathrm{j}}$. COCSR denotes the class of all schedules with this property.

Theorem 3.13:
COCSR $\subset$ CSR .

## Commit-order Preserving Conflict Serializability

## Definition 3.19 (Commit Order Preservation): <br> Schedule $s$ is commit order preserving conflict serializable if for all $\mathrm{t}_{\mathrm{i}}, \mathrm{t}_{\mathrm{j}} \in \operatorname{trans}(\mathrm{s})$ : if there are $\mathrm{p} \in \mathrm{t}_{\mathrm{i}}, \mathrm{q} \in \mathrm{t}_{\mathrm{j}}$ with $(\mathrm{p}, \mathrm{q}) \in \operatorname{conf}(\mathrm{s})$ then $\mathrm{c}_{\mathrm{i}}<\mathrm{c}_{\mathrm{j}}$. COCSR denotes the class of all schedules with this property.

## Theorem 3.13:

$\mathrm{COCSR} \subset \mathrm{CSR}$.

## Theorem 3.14:

Schedule s is in COCSR iff there is a serial schedule s' s.t. $\mathrm{s} \approx_{\mathrm{c}} \mathrm{s}^{\prime}$ and for all $\mathrm{t}_{\mathrm{i}}, \mathrm{t}_{\mathrm{j}} \in \operatorname{trans}(\mathrm{s}): \mathrm{t}_{\mathrm{i}}<_{\mathrm{s}^{\prime}} \mathrm{t}_{\mathrm{j}} \Leftrightarrow \mathrm{c}_{\mathrm{i}}<\mathrm{c}_{\mathrm{s}}$.

## Commit Serializability

Definition 3.20 (Closure Properties of Schedule Classes):
Let E be a class of schedules.
For schedule s let $\mathrm{CP}(\mathrm{s})$ denote the projection $\Pi_{\text {commit(s) }}$ (s).
$E$ is prefix-closed if the following holds: $s \in E \Leftrightarrow p \in E$ for each prefix of $s$.
E is commit-closed if the following holds: $\mathrm{s} \in \mathrm{E} \Rightarrow \mathrm{CP}(\mathrm{s}) \in \mathrm{E}$.
Theorem 3.16:
CSR is prefix-commit-closed, i.e., prefix-closed and commit-closed.

## Commit Serializability

## Interleaving Specifications: Motivation

Example: all transactions known in advance
transfer transactions on checking accounts a and b and savings account c :

$$
\begin{aligned}
& \mathrm{t}_{1}=\mathrm{r}_{1}(\mathrm{a}) \mathrm{w}_{1}(\mathrm{a}) \mathrm{r}_{1}(\mathrm{c}) \mathrm{w}_{1}(\mathrm{c}) \\
& \mathrm{t}_{2}=\mathrm{r}_{2}(\mathrm{~b}) \mathrm{w}_{2}(\mathrm{~b}) \mathrm{r}_{2}(\mathrm{c}) \mathrm{w}_{2}(\mathrm{c})
\end{aligned}
$$

balance transaction:

$$
t_{3}=r_{3}(a) r_{3}(b) r_{3}(c)

Let $\mathrm{IU}_{\mathrm{k}}\left(\mathrm{t}_{\mathrm{i}}, \mathrm{t}_{\mathrm{j}}\right)$ be an IU of $\mathrm{t}_{\mathrm{i}}$ relative to $\mathrm{t}_{\mathrm{j}}$. For an operation $\mathrm{p}_{\mathrm{i}} \in \mathrm{IU}_{\mathrm{k}}\left(\mathrm{t}_{\mathrm{i}}, \mathrm{t}_{\mathrm{j}}\right)$ let
(i) $\mathrm{F}\left(\mathrm{p}_{\mathrm{i}}, \mathrm{t}_{\mathrm{j}}\right)$ be the last operation in $\mathrm{IU}_{\mathrm{k}}\left(\mathrm{t}_{\mathrm{i}}, \mathrm{t}_{\mathrm{j}}\right)$ and
(ii) $\mathrm{B}\left(\mathrm{p}_{\mathrm{i}}, \mathrm{t}_{\mathrm{i}}\right)$ be the first operation in $\mathrm{IU}_{\mathrm{k}}\left(\mathrm{t}_{\mathrm{i}}, \mathrm{t}_{\mathrm{i}}\right)$.

## Definition 3.27 (Relative Serialization Graph):

The relative serialization graph $\operatorname{RSG}(\mathrm{s})=(\mathrm{V}, \mathrm{E})$ of schedule s is a graph with vertices $\mathrm{V}:=\mathrm{op}(\mathrm{s})$ and edge set $\mathrm{E} \subseteq \mathrm{V} \times \mathrm{V}$ containing four types of edges:
(i) for consecutive operations $\mathrm{p}, \mathrm{q}$ of the same transaction $(\mathrm{p}, \mathrm{q}) \in \mathrm{E}$ (I-edge)
(ii) if $\mathrm{p} \sim>^{*} \mathrm{q}$ for $\mathrm{p} \in \mathrm{t}_{\mathrm{i}}, \mathrm{q} \in \mathrm{t}_{\mathrm{j}}, \mathrm{t}_{\mathrm{i}} \neq \mathrm{t}_{\mathrm{j}}$, then $(\mathrm{p}, \mathrm{q}) \in \mathrm{E}$
(iii) if $(p, q)$ is a $D$-edge with $p \in t_{i}, q \in t_{j}$, then $\left(F\left(p, t_{j}\right), q\right) \in E$
(F-edge)
(iv) if $(\mathrm{p}, \mathrm{q})$ is a $D$-edge with $\mathrm{p} \in \mathrm{t}_{\mathrm{i}}, \mathrm{q} \in \mathrm{t}_{\mathrm{j}}$, then $\left(\mathrm{p}, \mathrm{B}\left(\mathrm{q}, \mathrm{t}_{\mathrm{i}}\right)\right) \in \mathrm{E}$
(B-edge)

## Theorem 3.18:

A schedule $s$ is relatively serializable iff $\operatorname{RSG}(\mathrm{s})$ is acyclic.

## RSG Example

## Example 3.19:

$$
\begin{aligned}
& \mathrm{t}_{1}=\mathrm{w}_{1}(\mathrm{x}) \mathrm{r}_{1}(\mathrm{z}) \\
& \mathrm{t}_{2}=\mathrm{r}_{2}(\mathrm{x}) \mathrm{w}_{2}(\mathrm{y}) \\
& \mathrm{t}_{3}=\mathrm{r}_{3}(\mathrm{z}) \mathrm{r}_{3}(\mathrm{y})
\end{aligned}
$$

$$
\begin{aligned}
& \mathrm{IU}\left(\mathrm{t}_{1}, \mathrm{t}_{2}\right)=<\left[\mathrm{w}_{1}(\mathrm{x}) \mathrm{r}_{1}(\mathrm{z})\right]> \\
& \mathrm{IU}\left(\mathrm{t}_{1}, \mathrm{t}_{3}\right)=<\left[\mathrm{w}_{1}(\mathrm{x})\right],\left[\mathrm{r}_{1}(\mathrm{z})\right]> \\
& \mathrm{IU}\left(\mathrm{t}_{2}, \mathrm{t}_{1}\right)=<\left[\mathrm{r}_{2}(\mathrm{x})\right],\left[\quad \mathrm{w}_{2}(\mathrm{y})\right]> \\
& \mathrm{IU}\left(\mathrm{t}_{2}, \mathrm{t}_{3}\right)=<\left[\mathrm{r}_{2}(\mathrm{x})\right],\left[\mathrm{w}_{2}(\mathrm{y})\right]> \\
& \mathrm{IU}\left(\mathrm{t}_{3}, \mathrm{t}_{1}\right)=<\left[\mathrm{r}_{3}(\mathrm{z})\right],\left[\mathrm{r} \mathrm{r}_{3}(\mathrm{y})\right]> \\
& \mathrm{IU}\left(\mathrm{t}_{3}, \mathrm{t}_{2}\right)=<\left[\mathrm{r}_{3}(\mathrm{z}) \mathrm{r}_{3}(\mathrm{y})\right]>
\end{aligned}
$$

## Lessons Learned

- Equivalence to serial history is a natural correctness criterion
- CSR, albeit less general than VSR,
is most appropriate for
- complexity reasons
- its monotonicity property
- its generalizability to semantically rich operations
- OCSR and COCSR have additional beneficial properties
