"Teamwork is essential. It allows you to blame someone else."(Anonymous)

## Part III: Recovery

- 11 Transaction Recovery
- 12 Crash Recovery: Notion of Correctness
- 13 Page-Model Crash Recovery Algorithms
- 14 Object-Model Crash Recovery Algorithms
- 15 Special Issues of Recovery
- 16 Media Recovery
- 17 Application Recovery

## Recall: Funds Transfer Example

```
void main () {
    /* read user input */
    scanf ("%d %d %d", &sourceid, &targetid, &amount);
    /* subtract amount from source account */
    EXEC SQL Update Account
    Set Balance = Balance - :amount Where Account_Id = :sourceid;
    /* add amount to target account */
    EXEC SQL Update Account
        Set Balance = Balance + :amount Where Account_Id = :targetid;
    EXEC SQL Commit Work; }
```

Observation: failures may cause inconsistencies, require recovery for "atomicity" and "durability"

## Also Recall: Dirty Read Problem

| P1 | Time | P2 |
| :---: | :---: | :---: |
| r (x) | 1 |  |
| $\mathrm{x}:=\mathrm{x}+100$ | 2 |  |
| w (x) | 3 |  |
|  | 5 | $\underline{x}:=\mathrm{x}-100$ |
| failure \& rollback | 6 | $\mathbf{w}(\mathbf{x})$ |

Observation: transaction rollbacks could affect concurrent transactions

## Chapter 11: Transaction Recovery

-11.2 Expanded Schedules

- 11.3 Page-Model Correctness Criteria
- 11.4 Sufficient Syntactic Conditions
- 11.5 Further Relationships Among Criteria
- 11.6 Extending Page-Model CC Algorithms
- 11.7 Object-Model Correctness Criteria
- 11.8 Extending Object-Model CC Algorithms
- 11.9 Lessons Learned
"And if you find a new way, you can do it today.
You can make it all true. And you can make it undo. "(Cat Stevens)

## Expanded Schedules with Explicit Undo Steps

Dirty-read problem:
$\mathrm{s}=\mathrm{r}_{1}(\mathrm{x}) \mathrm{w}_{1}(\mathrm{x}) \mathrm{r}_{2}(\mathrm{x}) \mathbf{a}_{\mathbf{1}} \mathrm{w}_{2}(\mathrm{x}) \mathrm{c}_{2}$

Approach:

- schedules with aborts are expanded by making the undo operations that implement the rollback explicit
- expanded schedules are analyzed by means of serializability arguments

Dirty-read in expanded schedule:
$\mathrm{s}^{\prime}=\mathrm{r}_{1}(\mathrm{x}) \mathrm{w}_{1}(\mathrm{x}) \mathrm{r}_{2}(\mathrm{x}) \mathrm{w}_{\mathbf{1}}{ }^{-1}(\mathbf{x}) \mathrm{c}_{1} \mathrm{w}_{2}(\mathrm{x}) \mathrm{c}_{2} \quad \rightarrow \notin \mathrm{CSR}$

## Examples

$$
s=r_{1}(x) w_{1}(x) r_{2}(y) w_{1}(y) w_{2}(y) a_{1} r_{2}(z) w_{2}(z) c_{2}
$$

Expansion?

How to handle active trasactions, as in

$$
\mathrm{s}=\mathrm{w}_{1}(\mathrm{x}) \mathrm{w}_{2}(\mathrm{x}) \mathrm{w}_{2}(\mathrm{y}) \mathrm{w}_{1}(\mathrm{x}) \quad ?
$$

## Formal Definition of Expanded Schedules

## Definition 11.1 (Expansion of a Schedule):

For a schedule $s$ the expansion of $s, \exp (s)$, is defined as follows:

- steps of $\exp (s)$ :
- $\mathrm{t}_{\mathrm{i}} \in \operatorname{commit}(\mathrm{s}) \Rightarrow \mathrm{op}\left(\mathrm{t}_{\mathrm{i}}\right) \subseteq \mathrm{op}(\exp (\mathrm{s}))$
- $\mathrm{t}_{\mathrm{i}} \in \operatorname{abort}(\mathrm{s}) \Rightarrow\left(\mathrm{op}\left(\mathrm{t}_{\mathrm{i}}\right)-\left\{\mathrm{a}_{\mathrm{i}}\right\}\right) \cup\left\{\mathrm{c}_{\mathrm{i}}\right\} \cup\left\{\mathrm{w}_{\mathrm{i}}^{-1}(\mathrm{x}) \mid \mathrm{w}_{\mathrm{i}}(\mathrm{x}) \in \mathrm{t}_{\mathrm{i}}\right\} \subseteq \mathrm{op}(\exp (\mathrm{s}))$
- $\mathrm{t}_{\mathrm{i}} \in \operatorname{active}(\mathrm{s}) \Rightarrow \mathrm{op}\left(\mathrm{t}_{\mathrm{i}}\right) \cup\left\{\mathrm{c}_{\mathrm{i}}\right\} \cup\left\{\mathrm{w}_{\mathrm{i}}^{-1}(\mathrm{x}) \mid \mathrm{w}_{\mathrm{i}}(\mathrm{x}) \in \mathrm{t}_{\mathrm{i}}\right\} \subseteq \mathrm{op}(\exp (\mathrm{s}))$
- step ordering in $\exp (\mathrm{s})$ :
- all steps from $o p(s) \cap o p(\exp (s))$ occur in $\exp (s)$ in the same order as in $s$
- all inverse steps of an aborted transaction occur in $\exp (s)$
after the original steps in $s$ and before the commit of this transaction
- all inverse steps of active transactions occur in $\exp (s)$ after the original steps of $s$ and before the commits of these transactions
- the ordering of inverse steps is the reverse of the ordering of the corresponding original steps

## Example 11.2:

$$
\begin{aligned}
& s=w_{1}(x) w_{2}(x) w_{2}(y) w_{1}(y) \\
& \Rightarrow \exp (s)=w_{1}(x) w_{2}(x) w_{2}(y) w_{1}(y) w_{1}^{-1}(y) w_{2}^{-1}(y) w_{2}^{-1}(x) w_{1}^{-1}(x) c_{2} c_{1}
\end{aligned}
$$

## Chapter 11: Transaction Recovery

- 11.2 Expanded Schedules

- 11.8 Extending Object-Model CC Algorithms
- 11.9 Lessons Learned

## Expanded Conflict Serializability (XCSR)

## Definition 11.2 (Expanded Conflict Serializability):

A schedule $s$ is expanded conflict serializable if its expansion, $\exp (s)$, is conflict serializable.
XCSR denotes the class of expanded conflict serializable schedules.

## Example 11.4:

- $\mathrm{s}=\mathrm{r}_{1}(\mathrm{x}) \mathrm{w}_{1}(\mathrm{x}) \mathrm{r}_{2}(\mathrm{x}) \mathrm{a}_{1} \mathrm{c}_{2}$
$\Rightarrow \exp (s)=r_{1}(x) w_{1}(x) r_{2}(x) w_{1}^{-1}(x) c_{1} c_{2} \quad \notin X C S R$
$s^{\prime}=r_{1}(x) W_{1}(x) a_{1} r_{2}(x) c_{2}$
$\Rightarrow \exp \left(s^{\prime}\right)=r_{1}(x) W_{1}(x) w_{1}^{-1}(x) c_{1} r_{2}(x) c_{2} \quad \in X C S R$
Lemma 11.1:
- $\mathrm{XCSR} \subset \mathrm{CSR}$

## Example 11.5:

- $s=w_{1}(x) w_{2}(x) a_{2} a_{1}$
$\Rightarrow \exp (s)=w_{1}(x) w_{2}(x) w_{2}^{-1}(x) c_{2} W_{1}^{-1}(x) c_{1} \quad \notin X C S R$

## Reducibility (RED)

## Definition 11.3 (Reducibility):

A schedule $s$ is reducible if its expansion, $\exp (s)$, can be transformed into a serial history by finitely many applications of the following rules:

- commutativity rule (CR):
if $\mathrm{p}, \mathrm{q} \in \operatorname{op}(\exp (\mathrm{s}))$ s.t. $\mathrm{p}<\mathrm{q}$ and $(\mathrm{p}, \mathrm{q}) \notin \operatorname{conf}(\exp (\mathrm{s}))$ and
if there is no step $\mathrm{o} \in \mathrm{op}(\exp (\mathrm{s}))$ with $\mathrm{p}<\mathrm{o}<\mathrm{q}$,
then the order of p and q can be reversed.
- undo rule (UR):
if $p, q \in \operatorname{op}(\exp (s))$ are inverses of each other (i.e., of the form $p=w_{i}(x)$ and $\mathrm{q}=\mathrm{w}_{\mathrm{i}}^{-1}(\mathrm{x})$ ) and if there is no other step o in between p and q , then the pair of steps p and q can be removed from $\exp (\mathrm{s})$.
- null rule (NR):
if $\mathrm{p} \in \operatorname{op}(\exp (\mathrm{s}))$ has the form $\mathrm{p}=\mathrm{r}_{\mathrm{i}}(\mathrm{x})$ s.t. $\mathrm{t}_{\mathrm{i}} \in \operatorname{active}(\mathrm{s}) \cup$ abort( s$)$, then $p$ can be removed from $\exp (\mathrm{s})$.
- ordering rule (OR):
two commutative, unordered operations can be arbitrarily ordered.

## Examples in RED and outside RED

Example 11.6:

```
\(\mathrm{s}=\mathrm{r}_{1}(\mathrm{x}) \mathrm{w}_{1}(\mathrm{x}) \mathrm{r}_{2}(\mathrm{x}) \mathrm{w}_{2}(\mathrm{x}) \mathrm{a}_{2} \mathrm{a}_{1}\)
\(\Rightarrow \exp (s)=r_{1}(x) w_{1}(x) r_{2}(x) w_{2}(x) w_{2}^{-1}(x) c_{2} W_{1}^{-1}(x) c_{1} \quad \in R E D\)
```

    \(\sim r_{1}(x) W_{1}(x) r_{2}(x) c_{2} W_{1}^{-1}(x) c_{1}\)
    \(\sim \mathrm{W}_{1}(\mathrm{x}) \mathrm{c}_{2} \mathrm{~W}_{1}^{-1}(\mathrm{x}) \mathrm{c}_{1}\)
    \(\sim \mathrm{W}_{1}(\mathrm{x}) \mathrm{w}_{1}^{-1}(\mathrm{x}) \mathrm{c}_{2} \mathrm{c}_{1}\)
    $$
\sim c_{2} c_{1}
$$

by UR
by NR
by CR
by UR

## Example 11.7:

$\mathrm{s}=\mathrm{w}_{1}(\mathrm{x}) \mathrm{r}_{2}(\mathrm{x}) \mathrm{c}_{1} \mathrm{c}_{2}$
$s$ is in RED, since reduction yields $s^{\prime}=W_{1}(x) c_{1} r_{2}(x) c_{2}$
Example 11.8:
$\mathrm{s}=\mathrm{w}_{1}(\mathrm{x}) \mathrm{w}_{2}(\mathrm{x}) \mathrm{c}_{2} \mathrm{c}_{1}$ with prefix $\mathrm{s}^{\prime}=\mathrm{w}_{1}(\mathrm{x}) \mathrm{w}_{2}(\mathrm{x}) \mathrm{c}_{2}$
$s$ is in RED, but $\mathrm{s}^{\prime}$ is not

## Prefix-Reducibility (PRED)

## Definition 11.9 (Prefix Reducibility):

A schedule s is prefix reducible if each of its prefixes is reducible. PRED denotes the class of all prefix-reducible schedules.

## Theorem 11.1:

- PRED $\subset$ RED (Lemma 11.2)
- $\mathrm{XCSR} \subset$ RED
- XCSR and PRED are incomparable

## Activity: Why Histories are [not] in PRED?

| 1) $w_{1}(x) r_{2}(x) a_{1} a_{2}$ | $\in \mathrm{PRED}$ |
| :---: | :---: |
| 2) $w_{1}(x) r_{2}(x) a_{1} c_{2}$ | $\notin \mathrm{PRED}$ |
| 3) $w_{1}(x) r_{2}(x) c_{2} c_{1}$ | $\notin \mathrm{PRED}$ |
| 4) $w_{1}(x) r_{2}(x) c_{2} a_{1}$ | $\notin \mathrm{PRED}$ |
| 5) $w_{1}(x) r_{2}(x) a_{2} a_{1}$ | $\in \mathrm{PRED}$ |
| 6) $w_{1}(x) r_{2}(x) a_{2} c_{1}$ | $\in \mathrm{PRED}$ |
| 7) $w_{1}(x) r_{2}(x) c_{1} c_{2}$ | $\in \mathrm{PRED}$ |
| 8) $w_{1}(x) r_{2}(x) c_{1} a_{2}$ | $\in \mathrm{PRED}$ |
| 9) $w_{1}(x) w_{2}(x) a_{1} a_{2}$ | $\notin \mathrm{PRED}$ |
| 10) $w_{1}(x) w_{2}(x) a_{1} c_{2}$ | $\notin$ PRED |
| 11) $\mathrm{w}_{1}(x) \mathrm{w}_{2}(\mathrm{x}) \mathrm{c}_{2} \mathrm{c}_{1}$ | $\notin$ PRED |
| 12) $w_{1}(x) w_{2}(x) c_{2} a_{1}$ | $\notin \mathrm{PRED}$ |
| 13) $w_{1}(x) w_{2}(x) a_{2} a_{1}$ | $\in \mathrm{PRED}$ |
| 14) $\mathrm{w}_{1}(x) \mathrm{w}_{2}(\mathrm{x}) \mathrm{a}_{2} \mathrm{c}_{1}$ | $\in \mathrm{PRED}$ |
| 15) $w_{1}(x) w_{2}(x) c_{1} c_{2}$ | $\in \mathrm{PRED}$ |
| 16) $\mathrm{w}_{1}(x) \mathrm{w}_{2}(\mathrm{x}) \mathrm{c}_{1} \mathrm{a}_{2}$ | $\in \mathrm{PRED}$ |

## Chapter 11: Transaction Recovery

- 11.2 Expanded Schedules
- 11.3 Page-Model Correctness Criteria
- 11.4 Sufficient Syntactic Conditions
- 11.5 Further Relationships Among Criteria
- 11.6 Extending Page-Model CC Algorithms
- 11.7 Object-Model Correctness Criteria
- 11.8 Extending Object-Model CC Algorithms
- 11.9 Lessons Learned

## Example

## Consider

$\mathrm{s}=\mathrm{w}_{1}(\mathrm{x}) \mathrm{r}_{2}(\mathrm{x}) \mathrm{c}_{2} \mathrm{a}_{1}$
s is not acceptable (why?),
yet an SR scheduler would consider it valid (why?).

## Sufficient Condition: Recoverability

## Definition 11.5 (Recoverability):

A schedule $s$ is recoverable if the following holds for all $\mathrm{t}_{\mathrm{i}}, \mathrm{t}_{\mathrm{j}} \in \operatorname{trans}(\mathrm{s})$ : if $t_{i}$ reads from $t_{j}$ in $s$ and $c_{i} \in o p(s)$, then $c_{j}<c_{i}$.
RC denotes the class of all recoverable schedules.
Example 11.10:

$$
\begin{array}{ll}
s_{1}=w_{1}(x) w_{1}(y) r_{2}(u) w_{2}(x) r_{2}(y) w_{2}(y) w_{3}(u) c_{3} c_{2} w_{1}(z) c_{1} & \notin R C \\
s_{2}=w_{1}(x) w_{1}(y) r_{2}(u) w_{2}(x) r_{2}(y) w_{2}(y) w_{3}(u) c_{3} w_{1}(z) c_{1} c_{2} & \in R C
\end{array}
$$

## Sufficient Condition: Avoidance of Cascading Aborts

Definition 11.20 (Avoiding Cascading Aborts):
A schedule $s$ avoids cascading aborts if the following holds for all $\mathrm{t}_{\mathrm{i}}, \mathrm{t}_{\mathrm{j}} \in \operatorname{trans}(\mathrm{s})$ : if $t_{i}$ reads $x$ from $t_{j}$ in $s$, then $c_{j}<r_{i}(x)$.
ACA denotes the class of all schedules that avoid cascading aborts.

## Examples 11.10 and 11.11:

| $s_{2}=w_{1}(x) w_{1}(y) r_{2}(u) w_{2}(x) r_{2}(y) w_{2}(y) w_{3}(u) c_{3} w_{1}(z) c_{1} c_{2}$ | $\notin A C A$ |
| :--- | :--- |
| $s_{3}=w_{1}(x) w_{1}(y) r_{2}(u) w_{2}(x) w_{1}(z) c_{1} r_{2}(y) w_{2}(y) w_{3}(u) c_{3} c_{2}$ | $\in A C A$ |
| $s=w_{0}(x, 1) c_{0} w_{1}(x, 2) w_{2}(x, 3) c_{2} a_{1}$ | $\in A C A$ |

## Sufficient Condition: Strictness

## Definition 11.7 (Strictness):

A schedule $s$ is strict if the following holds for all $t_{i}, t_{j} \in \operatorname{trans}(s)$ :
for all $\mathrm{p}_{\mathrm{i}}(\mathrm{x}) \in \mathrm{op}\left(\mathrm{t}_{\mathrm{i}}\right), \mathrm{p}=\mathrm{r}$ or $\mathrm{p}=\mathrm{w}$, if $\mathrm{w}_{\mathrm{j}}(\mathrm{x})<\mathrm{p}_{\mathrm{i}}(\mathrm{x})$ then $\mathrm{a}_{\mathrm{j}}<\mathrm{p}_{\mathrm{i}}(\mathrm{x})$ or $\mathrm{c}_{\mathrm{j}}<\mathrm{p}_{\mathrm{i}}(\mathrm{x})$. ST denotes the class of all strict schedules.

Example 11.11 and 11.13:

$$
\begin{array}{ll}
s_{3}=w_{1}(x) w_{1}(y) r_{2}(u) w_{2}(x) w_{1}(z) c_{1} r_{2}(y) w_{2}(y) w_{3}(u) c_{3} c_{2} & \notin S T \\
s_{4}=w_{1}(x) w_{1}(y) r_{2}(u) w_{1}(z) c_{1} w_{2}(x) r_{2}(y) w_{2}(y) w_{3}(u) c_{3} c_{2} & \in S T
\end{array}
$$

## Sufficient Condition: Rigorousness

## Definition 11.8 (Rigorousness):

A schedule $s$ is rigorous if it is strict and the following holds for all $\mathrm{t}_{\mathrm{i}}, \mathrm{t}_{\mathrm{j}} \in \operatorname{trans}(\mathrm{s})$ : if $r_{j}(x)<w_{i}(x)$ then $a_{j}<w_{i}(x)$ or $c_{j}<w_{i}(x)$.
RG denotes the class of all rigorous schedules.

## Example 11.13 and 11.14:

| $s_{4}=w_{1}(x) w_{1}(y) r_{2}(u) w_{1}(z) c_{1} w_{2}(x) r_{2}(y) w_{2}(y) w_{3}(u) c_{3} c_{2}$ | $\notin R G$ |
| :--- | :--- |
| $s_{5}=w_{1}(x) w_{1}(y) r_{2}(u) w_{1}(z) c_{1} w_{2}(x) r_{2}(y) w_{2}(y) c_{2} w_{3}(u) c_{3}$ | $\in R G$ |

## Situation

## Relationships Among Schedule Classes

Theorems 11.2, 11.3, 11.4:<br>- $\mathrm{RG} \subset \mathrm{ST} \subset \mathrm{ACA} \subset \mathrm{RC}$<br>- $\mathrm{RG} \subset \mathrm{COCSR}$<br>- $\mathrm{CSR} \cap \mathrm{ST} \subset \mathrm{PRED} \subset \mathrm{CSR} \cap \mathrm{RC}$

Proofs?

## Situation

## Log-Recoverability

## Definition 11.9 (Log Recoverability):

A schedule $s$ is $\log$ recoverable if the following properties hold:

- $s$ is recoverable
- for all $\mathrm{t}_{\mathrm{i}}, \mathrm{t}_{\mathrm{j}} \in \operatorname{trans}(\mathrm{s})$ : if there is a ww conflict of the form $\mathrm{w}_{\mathrm{i}}(\mathrm{x})<\mathrm{w}_{\mathrm{j}}(\mathrm{x})$ in s , then
- $\mathrm{a}_{\mathrm{i}}<\mathrm{w}_{\mathrm{j}}(\mathrm{x})$ or $\mathrm{c}_{\mathrm{i}}<\mathrm{c}_{\mathrm{j}}$ if $\mathrm{t}_{\mathrm{j}}$ commits,
- or $\mathrm{a}_{\mathrm{j}}<\mathrm{a}_{\mathrm{i}}$ if $\mathrm{t}_{\mathrm{i}}$ aborts.

LRC denotes the class of all log recoverable schedules.

Relationship to PRED for wr and ww conflicts:

| 1) | $w_{1}(x) r_{2}(x) a_{1} a_{2}$ | $\in$ PRED | 1) | $\mathrm{w}_{1}(\mathrm{x}) \mathrm{w}_{2}(\mathrm{x}) \mathrm{a}_{1} \mathrm{a}_{2}$ | $\notin \mathrm{PRED}$ |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 2) | $w_{1}(x) r_{2}(x) a_{1} c_{2}$ | $\notin$ PRED | 2) | $\mathrm{w}_{1}(\mathrm{x}) \mathrm{w}_{2}(\mathrm{x}) \mathrm{a}_{1} \mathrm{c}_{2}$ | $\notin \mathrm{PRED}$ |
| 3) | $\mathrm{w}_{1}(\mathrm{x}) \mathrm{r}_{2}(\mathrm{x}) \mathrm{c}_{2} \mathrm{c}_{1}$ | $\notin$ PRED | 3) | $\mathrm{w}_{1}(\mathrm{x}) \mathrm{w}_{2}(\mathrm{x}) \mathrm{c}_{2} \mathrm{c}_{1}$ | $\notin \mathrm{PRED}$ |
| 4) | $\mathrm{w}_{1}(\mathrm{x}) \mathrm{r}_{2}(\mathrm{x}) \mathrm{c}_{2} \mathrm{a}_{1}$ | $\notin$ PRED | 4) | $\mathrm{w}_{1}(\mathrm{x}) \mathrm{w}_{2}(\mathrm{x}) \mathrm{c}_{2} \mathrm{a}_{1}$ | $\notin \mathrm{PRED}$ |
| 5) | $\mathrm{w}_{1}(\mathrm{x}) \mathrm{r}_{2}(\mathrm{x}) \mathrm{a}_{2} \mathrm{a}_{1}$ | $\in \mathrm{PRED}$ | 5) | $\mathrm{w}_{1}(\mathrm{x}) \mathrm{w}_{2}(\mathrm{x}) \mathrm{a}_{2} \mathrm{a}_{1}$ | $\in \mathrm{PRED}$ |
| 6) | $w_{1}(x) r_{2}(x) a_{2} c_{1}$ | $\in \mathrm{PRED}$ | 6) | $\mathrm{w}_{1}(\mathrm{x}) \mathrm{w}_{2}(\mathrm{x}) \mathrm{a}_{2} \mathrm{c}_{1}$ | $\in \mathrm{PRED}$ |
| 7) | $\mathrm{w}_{1}(\mathrm{x}) \mathrm{r}_{2}(\mathrm{x}) \mathrm{c}_{1} \mathrm{c}_{2}$ | $\in \mathrm{PRED}$ | 7) | $\mathrm{w}_{1}(\mathrm{x}) \mathrm{w}_{2}(\mathrm{x}) \mathrm{c}_{1} \mathrm{c}_{2}$ | $\in \mathrm{PRED}$ |
| 8) | $\mathrm{w}_{1}(\mathrm{x}) \mathrm{r}_{2}(\mathrm{x}) \mathrm{c}_{1} \mathrm{a}_{2}$ | $\in \mathrm{PRED}$ | 8) | $\mathrm{w}_{1}(\mathrm{x}) \mathrm{w}_{2}(\mathrm{x}) \mathrm{c}_{1} \mathrm{a}_{2}$ | $\in \mathrm{PRED}$ |

## Relationship Between LRC and PRED

## Theorem 11.5:

- $\operatorname{PRED}=\mathrm{CSR} \cap \mathrm{LRC}$

## Proof sketch:

- Lemma 11.3: If $\mathrm{s} \in \mathrm{CSR} \cap \mathrm{LRC}$, then all operations of uncommitted transactions can be eliminated using rules CR, UR, NR, and OR.
- PRED $\supseteq \mathrm{CSR} \cap \mathrm{LRC}$ :

Assume $\mathrm{s} \in \mathrm{CSR} \cap \mathrm{LRC}$.
After eliminating operations of uncommitted transactions by Lemma 11.31
(and preserving all conflict orders among committed transactions), $s$ is still CSR and so is every prefix of $s$. Thus $s$ is in PRED.

- PRED $\subseteq$ LRC:

Assume $\mathrm{s} \in$ PRED but $\notin$ LRC. Consider a conflict $\mathrm{w}_{\mathrm{i}}(\mathrm{x})<\mathrm{w}_{\mathrm{j}}(\mathrm{x})$. Since $\mathrm{s} \notin$ LRC, either a) $t_{j}$ commits but $t_{i}$ does not commit or commits after $t_{j}$ or b) $\mathrm{t}_{\mathrm{i}}$ aborts but $\mathrm{t}_{\mathrm{j}}$ does not abort or aborts after $\mathrm{t}_{\mathrm{i}}$.
All cases lead to contradictions to the assumption that $s$ is in PRED.
Similarly, assuming that s does not satisfy the RC property for situations
like $\mathrm{w}_{\mathrm{i}}(\mathrm{x})<\mathrm{r}_{\mathrm{j}}(\mathrm{x}) \mathrm{c}_{\mathrm{j}}$, leads to a contradiction.

- $\mathrm{PRED} \subseteq \mathrm{CSR}$

## Situation

## Extending 2PL for ST and RG

## Theorem 11.6:

Gen(SS2PL) = RG

## Theorem 11.7:

$\mathrm{Gen}(\mathrm{S} 2 \mathrm{PL}) \subseteq \mathrm{CSR} \cap \mathrm{ST}$

## Extending SGT for LRC

## Approach:

- defer commit upon commit request of $t_{j}$
if there is a ww or wr conflict from $t_{i}$ to $t_{j}$ and $t_{i}$ is not yet committed
- enforce cascading abort for $t_{j}$ upon abort request of $t_{i}$ if there is a ww or wr conflict from $t_{i}$ to $t_{j}$

## ESGT algorithm:

- process w and r steps as usual and maintain serialization graph with explicit labeling of edges that correspond to ww or wr conflicts
- upon $\mathrm{c}_{\mathrm{i}}$ test if $\mathrm{t}_{\mathrm{i}}$ has a predecessor w.r.t. ww or wr edges in the graph; if no predecessor exists then perform $\mathrm{c}_{\mathrm{i}}$ and resume waiting successors
- upon $\mathrm{a}_{\mathrm{i}}$ test if $\mathrm{t}_{\mathrm{i}}$ has successor w.r.t. ww or wr edges in the graph;
if no successor exists then perform $\mathrm{a}_{\mathrm{i}}$, otherwise enforce aborts for all successors of $t_{i}$

> Theorem 11.8:
> Gen $(\mathrm{ESGT}) \subseteq \mathrm{CSR} \cap \mathrm{LRC}$

Remark: similar approaches are feasible for other CC protocols (including non-strict 2PL)

## Aborts in Flat Object Schedules

## Definition 11.10 (Inverse operations):

An operation $\mathrm{f}^{\prime}\left(\mathrm{x}_{1}{ }^{\prime}, \ldots, \mathrm{x}_{\mathrm{m}^{\prime}}\right.$, $\uparrow_{\mathrm{y}_{1}}{ }^{\prime}, \ldots, \uparrow_{\mathrm{y}_{\mathrm{k}^{\prime}}}$ ) with input parameters $\mathrm{x}_{1}{ }^{\prime}$ through $\mathrm{x}_{\mathrm{m}}{ }^{\prime}$ and output parameters $\mathrm{y}_{1}$ ' through $\mathrm{y}_{\mathrm{k}^{\prime}}$ ' is the inverse operation of operation $f\left(x_{1}, \ldots, x_{m}, \uparrow_{y_{1}}, \ldots, \uparrow_{y_{k}}\right)$ if
for all possible sequences $\alpha$ and $\omega$ of operations on a given interface, the return parameters in the sequence $\alpha \mathrm{f}(\ldots) \mathrm{f}^{\prime}(\ldots) \omega$ are the same as in $\alpha \omega$. $f^{\prime}(\ldots)$ is also denoted as $f^{-1}(\ldots)$.

With the notion of inverse operations, the concepts of expanded schedules and PRED generalize to flat object schedules.

Examples 11.17 and 11.18:
$\mathrm{s}_{1}=$ withdraw $_{1}(\mathrm{a})$ withdraw $_{2}(\mathrm{~b}) \operatorname{deposit}_{2}(\mathrm{c}) \operatorname{deposit}_{1}(\mathrm{c}) \mathrm{c}_{1} \mathrm{a}_{2} \in \operatorname{PRED}$
$\Rightarrow \exp \left(\mathrm{s}_{1}\right)=$
withdraw $_{1}\left(\right.$ a) withdraw $_{2}(\mathrm{~b})$ deposit $_{2}(\mathrm{c})$ deposit $_{1}(\mathrm{c}) \mathrm{c}_{1}$ reclaim $_{2}(\mathrm{c})$ deposit $_{2}(\mathrm{~b}) \mathrm{c}_{2}$
$\mathrm{s}_{2}=\operatorname{insert}_{1}(\mathrm{x}) \operatorname{delete}_{2}(\mathrm{x}) \operatorname{insert}_{3}(\mathrm{y}) \mathrm{a}_{1} \mathrm{a}_{2} \mathrm{a}_{3} \notin \operatorname{PRED}$
$\Rightarrow \exp \left(\mathrm{s}_{2}\right)=\operatorname{insert}_{1}(\mathrm{x}) \operatorname{delete}_{2}(\mathrm{x}) \operatorname{insert}_{3}(\mathrm{y}) \operatorname{delete}_{1}(\mathrm{x}) \mathrm{c}_{1} \operatorname{insert}_{2}(\mathrm{x}) \mathrm{c}_{2} \operatorname{delete}_{3}(\mathrm{y}) \mathrm{c}_{3}$

## Example of Correctly Expanded Flat Object Schedule

$\sqrt{\square}$ Expansion

## Example of Incorrectly Expanded Flat Object Schedule

not treereducible

Important observation:
Page-level undo is, in general, incorrect for object-model transactions.

## Perfect Commutativity

## Definition 11.11 (Perfect Commutativity):

Given a set of operations for an object type, such that for each operation $\mathrm{f}\left(\mathrm{x}, \mathrm{p}_{1}, \ldots, \mathrm{p}_{\mathrm{m}}\right)$ an appropriate inverse operation $\mathrm{f}^{-1}\left(\mathrm{x}, \mathrm{p}_{1}{ }^{\prime}, \ldots, \mathrm{p}_{\mathrm{m}^{\prime}}{ }^{\prime}\right)$ is included. A commutativity table for these operations is called perfect if the following holds: if $f\left(x, p_{1}, \ldots, p_{m}\right)$ and $g\left(x, q_{1}, \ldots, q_{n}\right)$ commute then $f\left(x, p_{1}, \ldots, p_{m}\right)$ and $g^{-1}\left(x, q_{1}{ }^{\prime} \ldots, q_{n^{\prime}}\right)$ commute, $\mathrm{f}^{-1}\left(\mathrm{x}, \mathrm{p}_{1}{ }^{\prime}, \ldots, \mathrm{p}_{\mathrm{m}^{\prime}}\right)$ and $\mathrm{g}\left(\mathrm{x}, \mathrm{q}_{1}, \ldots, \mathrm{q}_{\mathrm{n}}\right)$ commute, and $\mathrm{f}^{-1}\left(\mathrm{x}, \mathrm{p}_{1}{ }^{\prime}, \ldots, \mathrm{p}_{\mathrm{m}^{\prime}}\right)$ and $\mathrm{g}^{-1}\left(\mathrm{x}, \mathrm{q}_{1}{ }^{\prime} \ldots, \mathrm{q}_{\mathrm{n}^{\prime}}{ }^{\prime}\right)$ commute.

## Definition 11.12 (Perfect Closure):

The perfect closure of a commutativity table for the operations of a given object type is the largest, perfect subset of the original commutativity table's commutative operation pairs.

## Important observation:

For object types with perfect or perfectly closed commutativity tables, S2PL does not need to acquire any additional locks for undo, and therefore is deadlock-free during rollback.

## Examples of Commutativity Tables with Inverse Operations

for object type "page"

|  | $\mathrm{r}_{\mathrm{i}}(\mathrm{x}) \mathrm{w}_{\mathrm{i}}(\mathrm{x}) \mathrm{w}_{\mathrm{i}}{ }^{-1}(\mathrm{x})$ |  |  |  |
| :---: | :---: | :---: | :---: | :---: |
| $\mathrm{r}_{\mathrm{i}}(\mathrm{x})$ | + | - | - |  |
| $\mathrm{w}_{\mathrm{i}}(\mathrm{x})$ | - | - | - |  |
| $\mathrm{wi}^{-1}(\mathrm{x})$ | - | - | - |  |

for object type "set"

| insert delete | insert delete test insert ${ }^{-1}$ delete $^{-1}$ |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - |
|  | - | - | - | - | - |
| test | - | - | + | - | - |
| insert ${ }^{-1}$ | - | - | - | $+$ | - |
| delete ${ }^{-1}$ | - | - | - | - | + |
| not perfect |  |  |  |  |  |

insert delete test insert ${ }^{-1}$ delete $^{-1}$

| - | - | - | - | - |
| :---: | :---: | :---: | :---: | :---: |
| - | - | - | - | - |
| - | - | + | - | - |
| - | - | - | - | - |
| - | - | - | - | - |
| perfectly closed |  |  |  |  |

## Complete and Partial Rollbacks in General Object-Model Schedules

## Definition 11.15 (Terminated Subtransactions):

An object-model history has terminated subtransactions if each non-leaf node $\mathrm{p}_{\omega}$ has either a child $\mathrm{c}_{\omega v}$ or $\mathrm{a}_{\omega v}$ that follows all other ( $\mathrm{v}-1$ ) children of $\mathrm{p}_{\omega}$. An object-model schedule with terminated subtransactions is a prefix of an object-model history with terminated subtransactions.

## Definition 11.16 (Expanded Object Model Schedule):

For an object model schedule s with terminated subtransactions the expansion of $\mathrm{s}, \exp (\mathrm{s})$, is an object-model history derived as follows:

- All operations whose parent has a commit child are included in $\exp (\mathrm{s})$.
- For each operation whose parent $\mathrm{p}_{\omega}$ has an abort child $\mathrm{a}_{\omega v}$ an inverse operation is added for all of p's children that do themselves have a commit child, and a commit child is added to $p$.
The inverse operations have the reverse order of the corresponding forward operations and placed in between the forward operations and the new commit child. All new children of $p$ precede an operation $q$ in $\exp (s)$ if the abort child of $p$ preceded q in s .
- For each transaction in active(s) and each non-terminated subtransaction, inverse operations and a final commit child are added as children of the transaction roots, with ordering analagous to above.

# Tree Prefix Reducibility for General Object-Model Schedules with Complete and Partial Rollbacks 

```
Definition 11.17 (Extended Tree Reducibility):
An object model schedule s is extended tree reducible if its expansion, exp(s),
can be transformed into a serial order of s's committed transaction roots by
applying the following rules finitely many times:
    1. the commutativity rule applied to adjacent leaves,
    2. the tree-pruning rule for isolated subtrees,
    3. the undo rule applied to adjacent leaves,
    4. the null rule for read-only operations, and
    5. the ordering rule applied to unordered leaves.
```

## Example with Complete and Partial Rollbacks

## Extending Layered Concurrency Control for Complete and Partial Rollbacks

## Definition 11.14 (Strictness):

A flat object schedule $s$ is strict if for each pair of L1 operations, $p_{j}$ and $q_{i}$, from different transactions $t_{i}$ and $t_{j}$ such that $p_{j}$ is an update operation, the order $\mathrm{p}_{\mathrm{j}}<\mathrm{q}_{\mathrm{i}}$ implies that $\mathrm{a}_{\mathrm{j}}<\mathrm{q}_{\mathrm{i}}$ or $\mathrm{c}_{\mathrm{j}}<\mathrm{q}_{\mathrm{i}}$.

## Theorem 11.10:

A layered object-model schedule for which all level-to-level schedules are order-preserving conflict serializable and strict is extended tree reducible.

## Theorem 11.12:

The layered S2PL protocol with perfect commutativity tables generates only schedules that are extended tree reducible.

## Chapter 11: Transaction Recovery

- 11.2 Expanded Schedules
- 11.3 Page-Model Correctness Criteria
- 11.4 Sufficient Syntactic Conditions
- 11.5 Further Relationships Among Criteria
- 11.6 Extending Page-Model CC Algorithms
- 11.7 Object-Model Correctness Criteria
- 11.8 Extending Object-Model CC Algorithms
-11.9 Lessons Learned

## Lessons Learned

- PRED captures correct schedules in the presence of aborts by means of intuitive transformation rules.
- Among the sufficient syntactic criteria, LRC, ACA, ST, and RG (all in conjunction with CSR), ST is the most practical one.
- Consequently, S2PL is the method of choice (and can be shown to guarantee PRED).
- PRED carries over to the object model, in combination with the transformation rules of tree-reducibility, leading to TPRED, and captures both complete and partial rollbacks of transactions.
- The most practical sufficient syntactic condition for layered schedules with perfect commutativity requires OCSR and ST for each level-to-level schedule, and can be implemented by layered S2PL.
